

Writing this was not difficult but it was challenging to get everything placed how it is. Luckily I have saved files in VS code from this class and, I'll reference this at the end, HCI406. I referenced a file made in IT411 named, 'tipCalc.js' for help in improving the javascript file. Prior to the previous lecture my peers and I discussed some issues we were facing and what we were unsure of. This helped me to see how they were implementing using open <option> and closing </option> as well as <select>, </select> for interactive dropdown menus. And discussing with my peers helped me to remember to include an open and close , as well as for presenting lists of what my dessert menu presents. When using my VS code I ran a debugger in my VS code to point out to me how I am writing my getElementById as '....getElementById. I searched it online and it took me to this site:

<https://career Karma.com/blog/javascript-document-getelementbyid-is-not-a-function/> .

This was helpful for me in applying more attention as it states this method to be case sensitive. In my HCI406 files we worked on installing extensions. So one of the extensions I used when doing this desserts.html file was the 'Live preview' extension. I quite like it as I can see in real time what my webpage is coming out to be. This was fun!

PS: I would like to say the path on here may say rylee in the zip file which is my partner as this is her computer! thanks
